

# Kabir/Crawford Data Summary File

- Provides yield vs.  $t - t_{\text{drop}}$  for each wire.
- Separate accounting for dropped pulses w/ RFSF on and RFSF off.
- No irregular dropped pulses.
- 5% of U/D data; no irregular dropped pulses

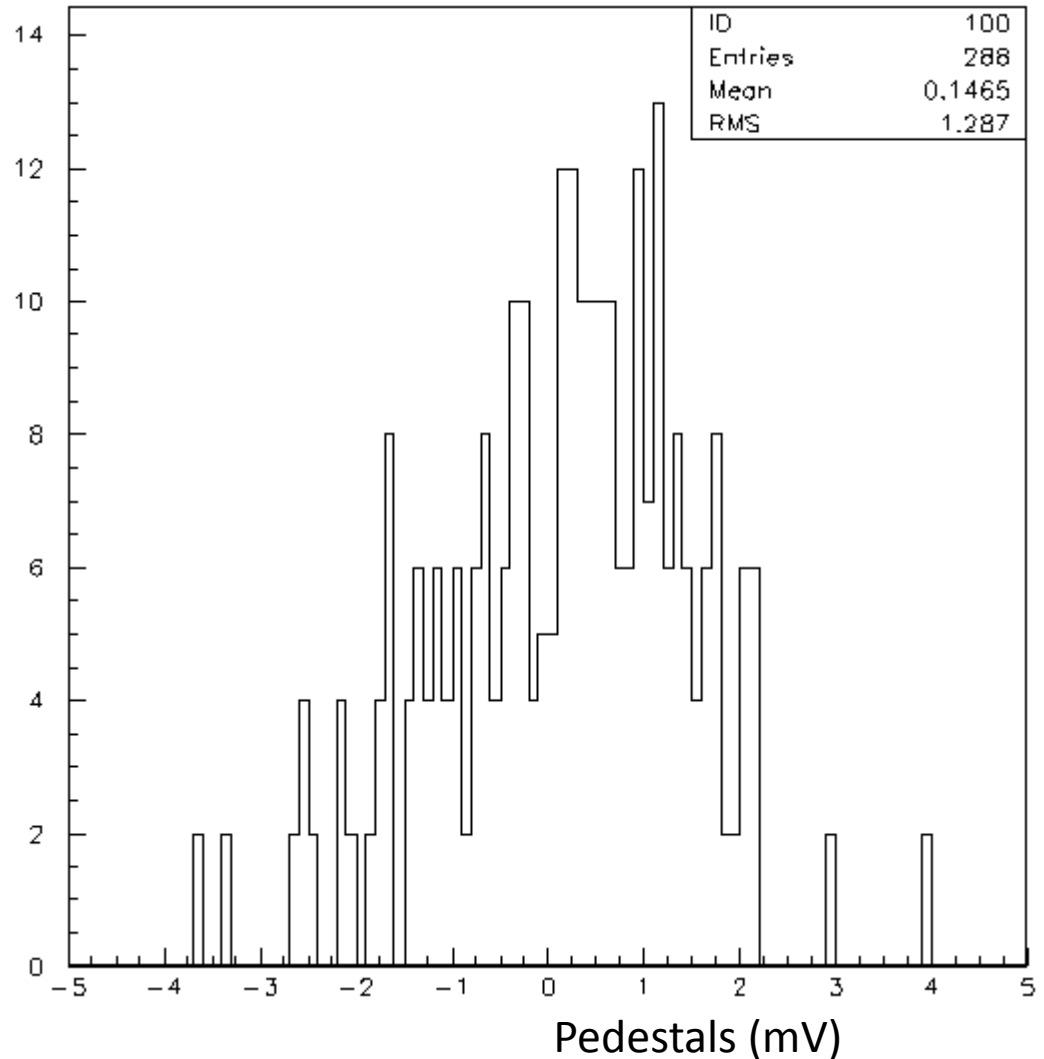

# Pedestals

- Pedestal value for each wire: average yield in time bin 36 of dropped pulse

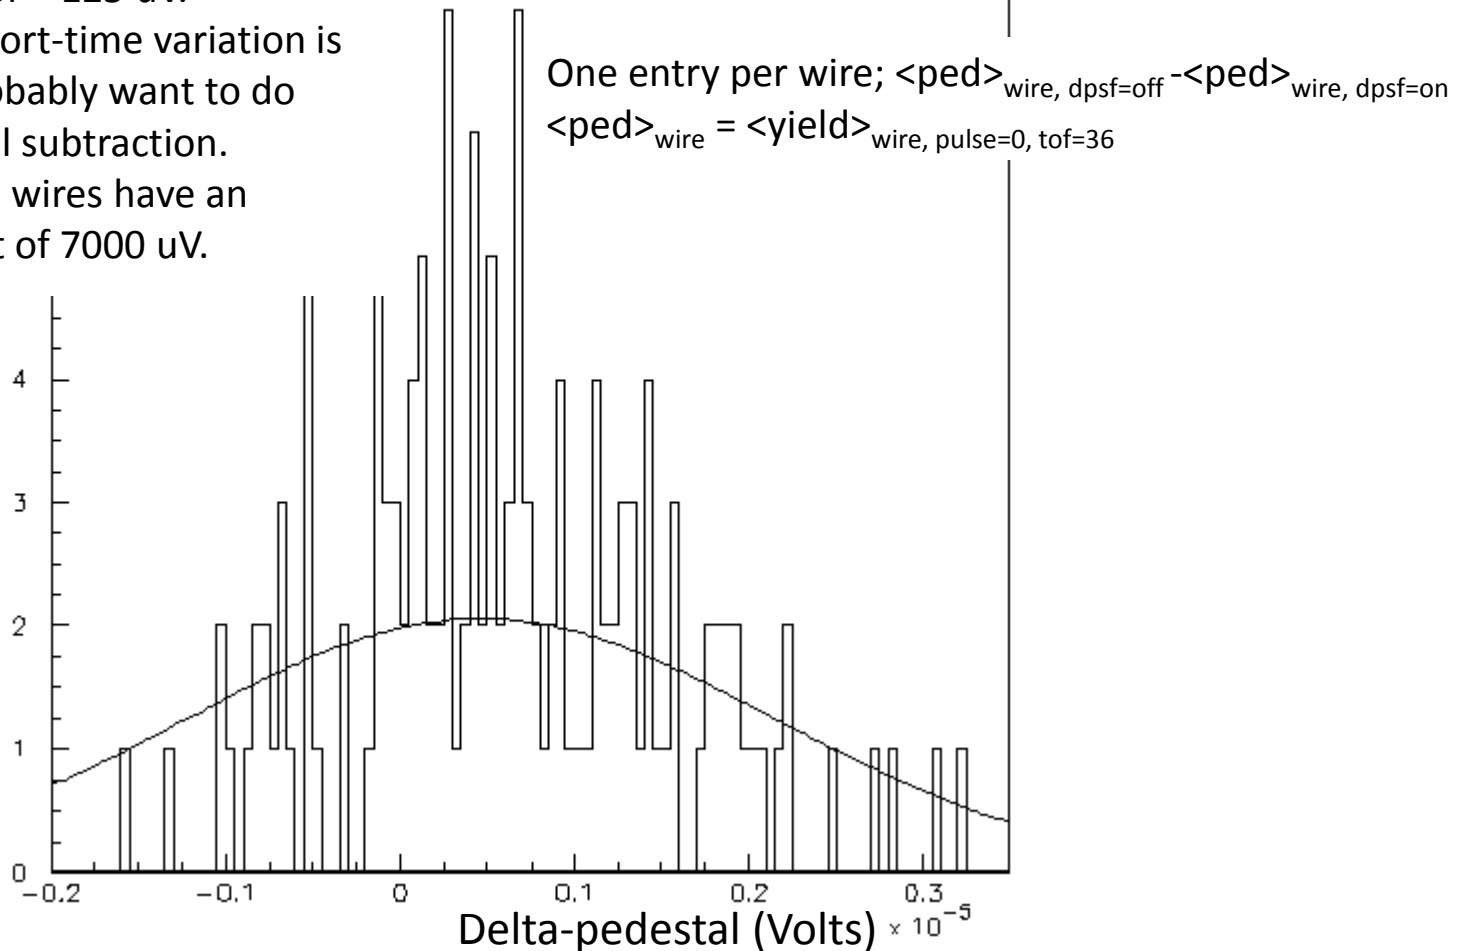

# Pedestal Values

- One entry per wire for each of the two dropped pulse spin-flipper states.
- For scale, back/edge wires have signals of <10 mV.

# Pedestal Variation

- Gaussian width (1.4  $\mu\text{V}$ ) implies underlying pedestal variations of  $\sim 125 \mu\text{V}$ .
- Since (I think) the short-time variation is less than this we probably want to do "time-local" pedestal subtraction.
- For scale: back/edge wires have an average pulse height of 7000  $\mu\text{V}$ .

# Pedestal Message

- We do need to account for pedestals.
- The regular dropped pulses provide a convenient measure of the pedestal, but we need to look at the behavior vs. time to make sure that variations within the 600-pulse interval are sufficiently small to make it a good measure.

# “Negative Image Pulse”

Average yield vs. time after a dropped pulse for each wire:

$$Y'_{\text{wire, pulse, tof}} = \frac{1}{2} \sum_{\text{spin}} \frac{(Y_{\text{spin, wire, pulse, tof}} - P_{\text{spin, wire}})}{\text{NSEQ}_{\text{spin}}}$$

Expected average yield (perfect peak) vs. time after start of a pulse for each wire:

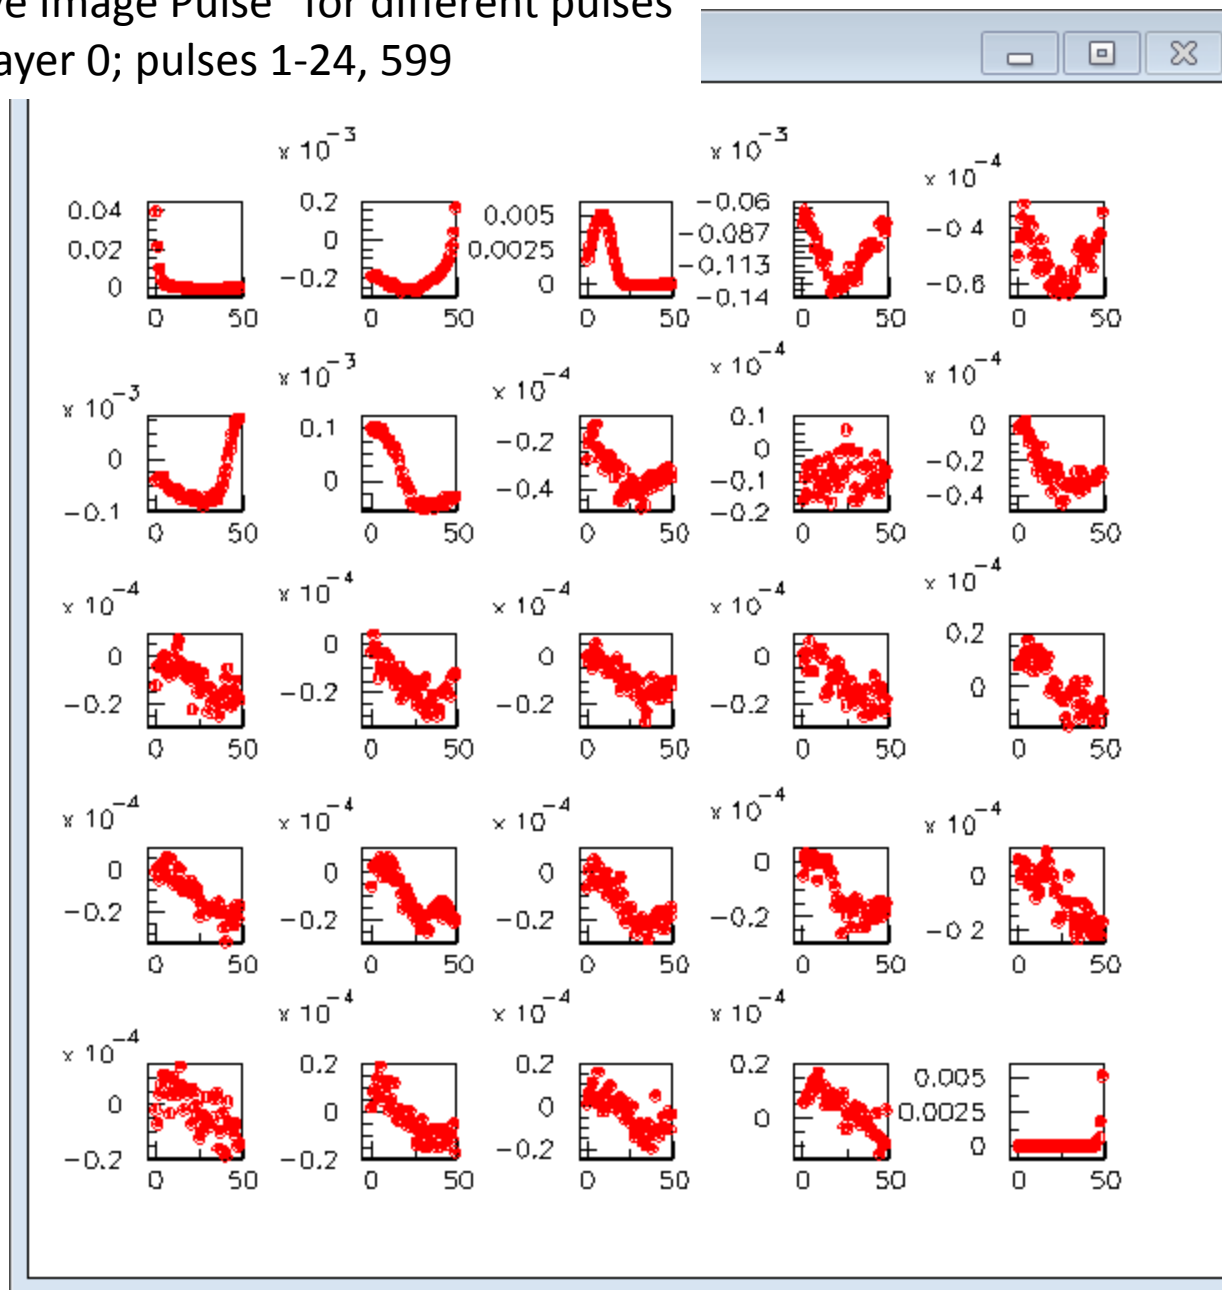

$$PP_{\text{wire, tof}} = \frac{1}{599} \sum_{\text{pulse}} Y'_{\text{wire, pulse, tof}}$$

Negative Image Pulse vs. time after start of a pulse for each wire:

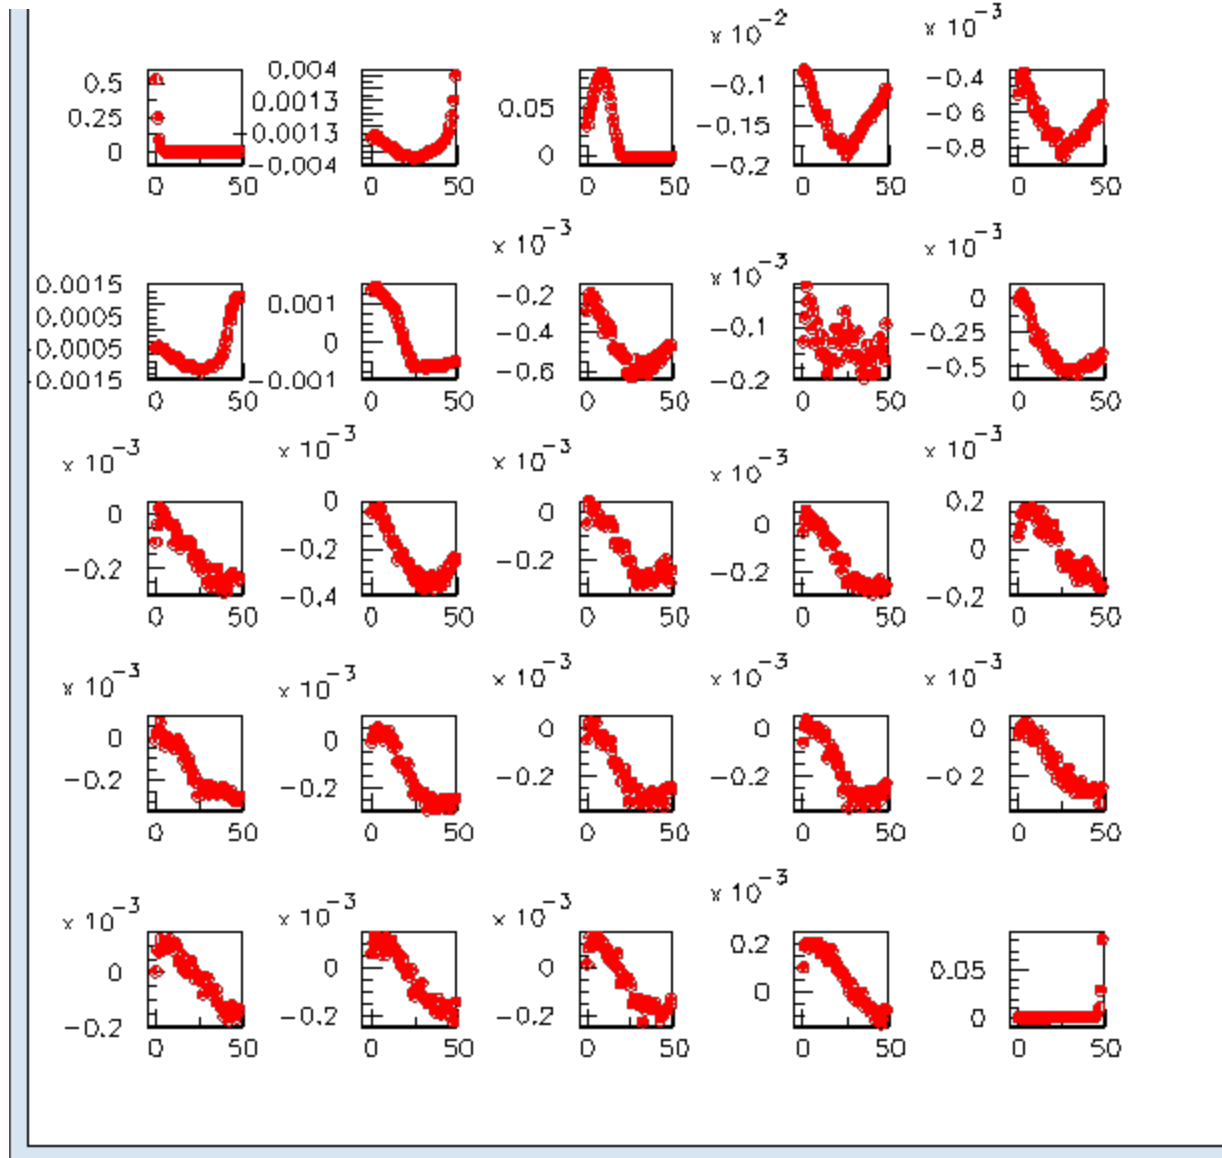

$$NIP_{\text{wire, pulse, tof}} = Y_{\text{wire, pulse, tof}} - PP_{\text{wire, tof}}$$

y-axes for all following plots are in volts

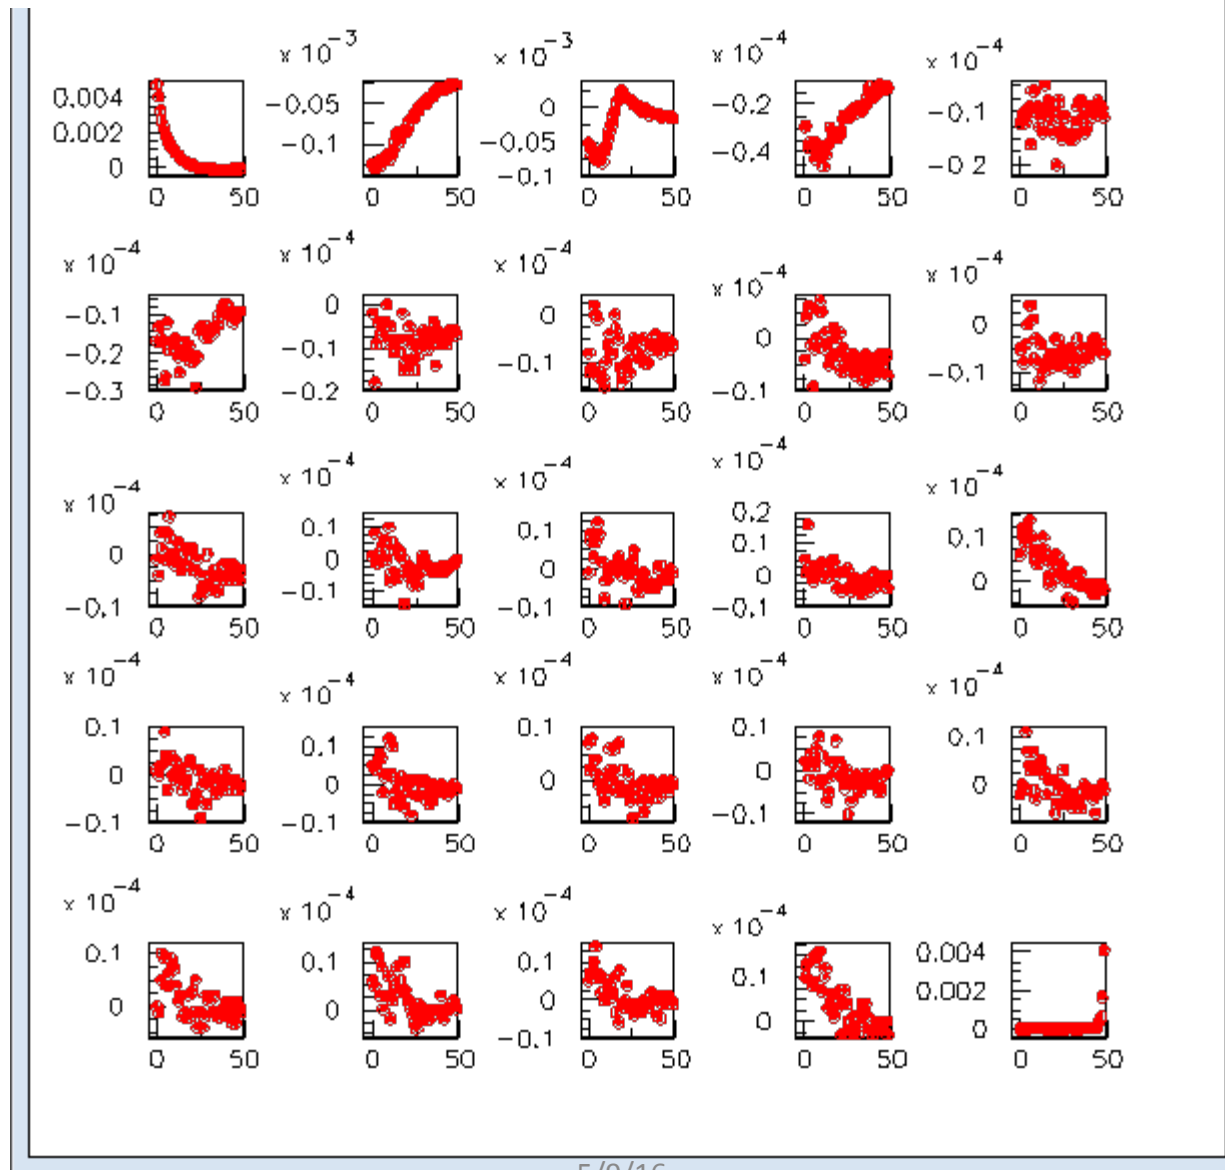

"Negative Image Pulse" for different pulses  
wire 0, layer 0; pulses 1-24, 599

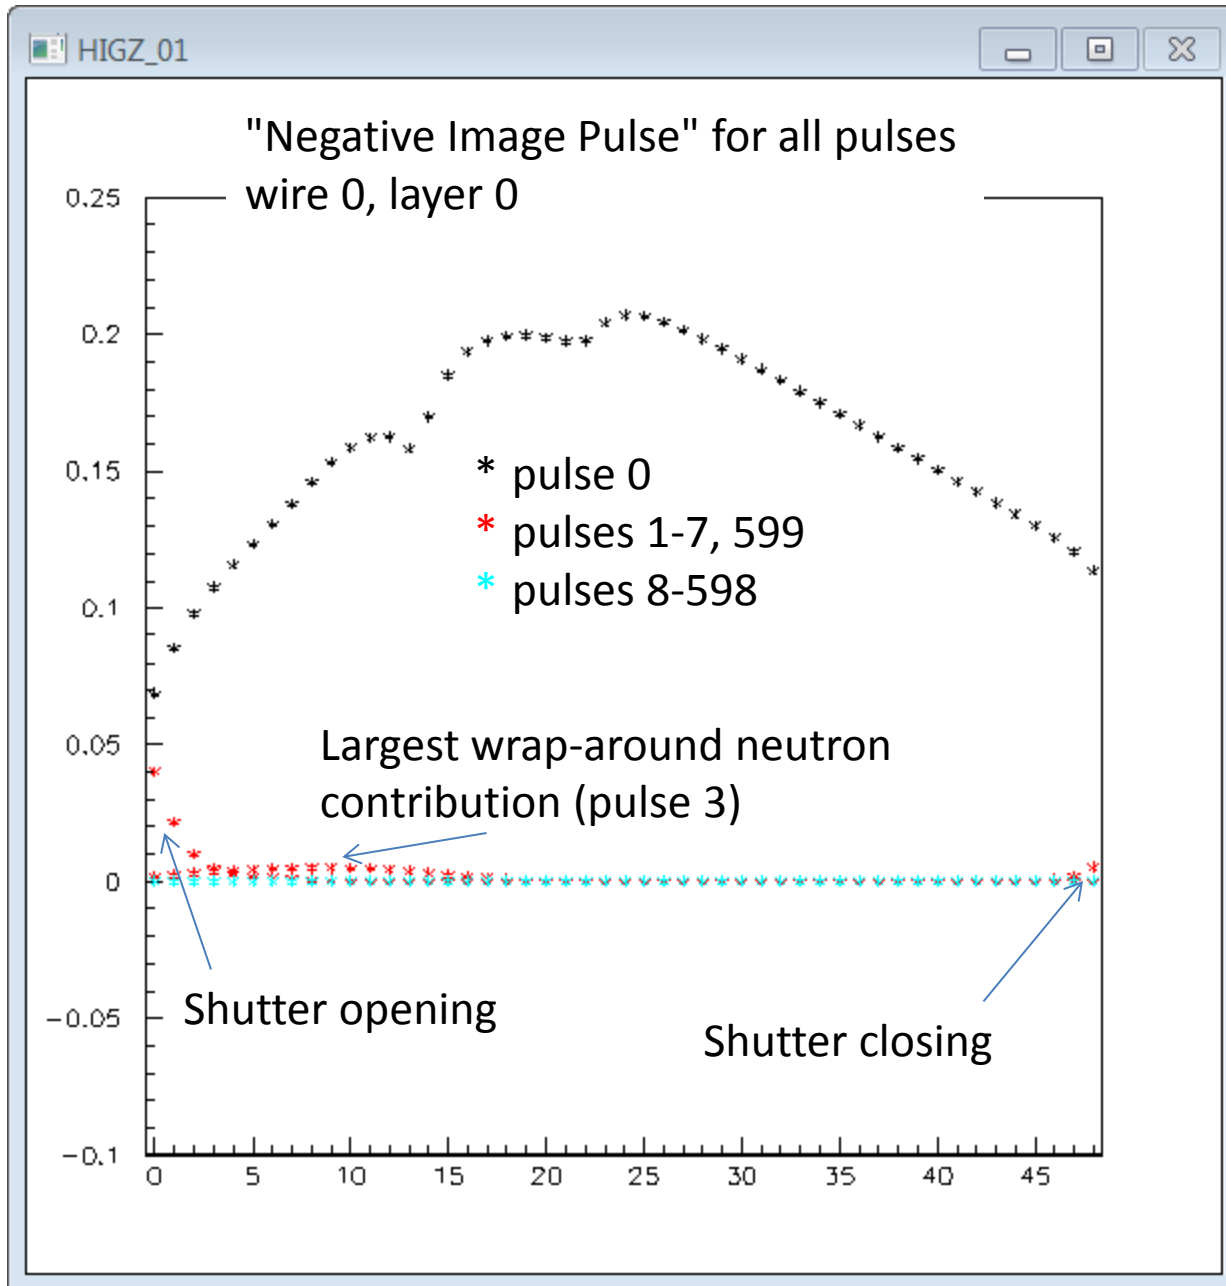

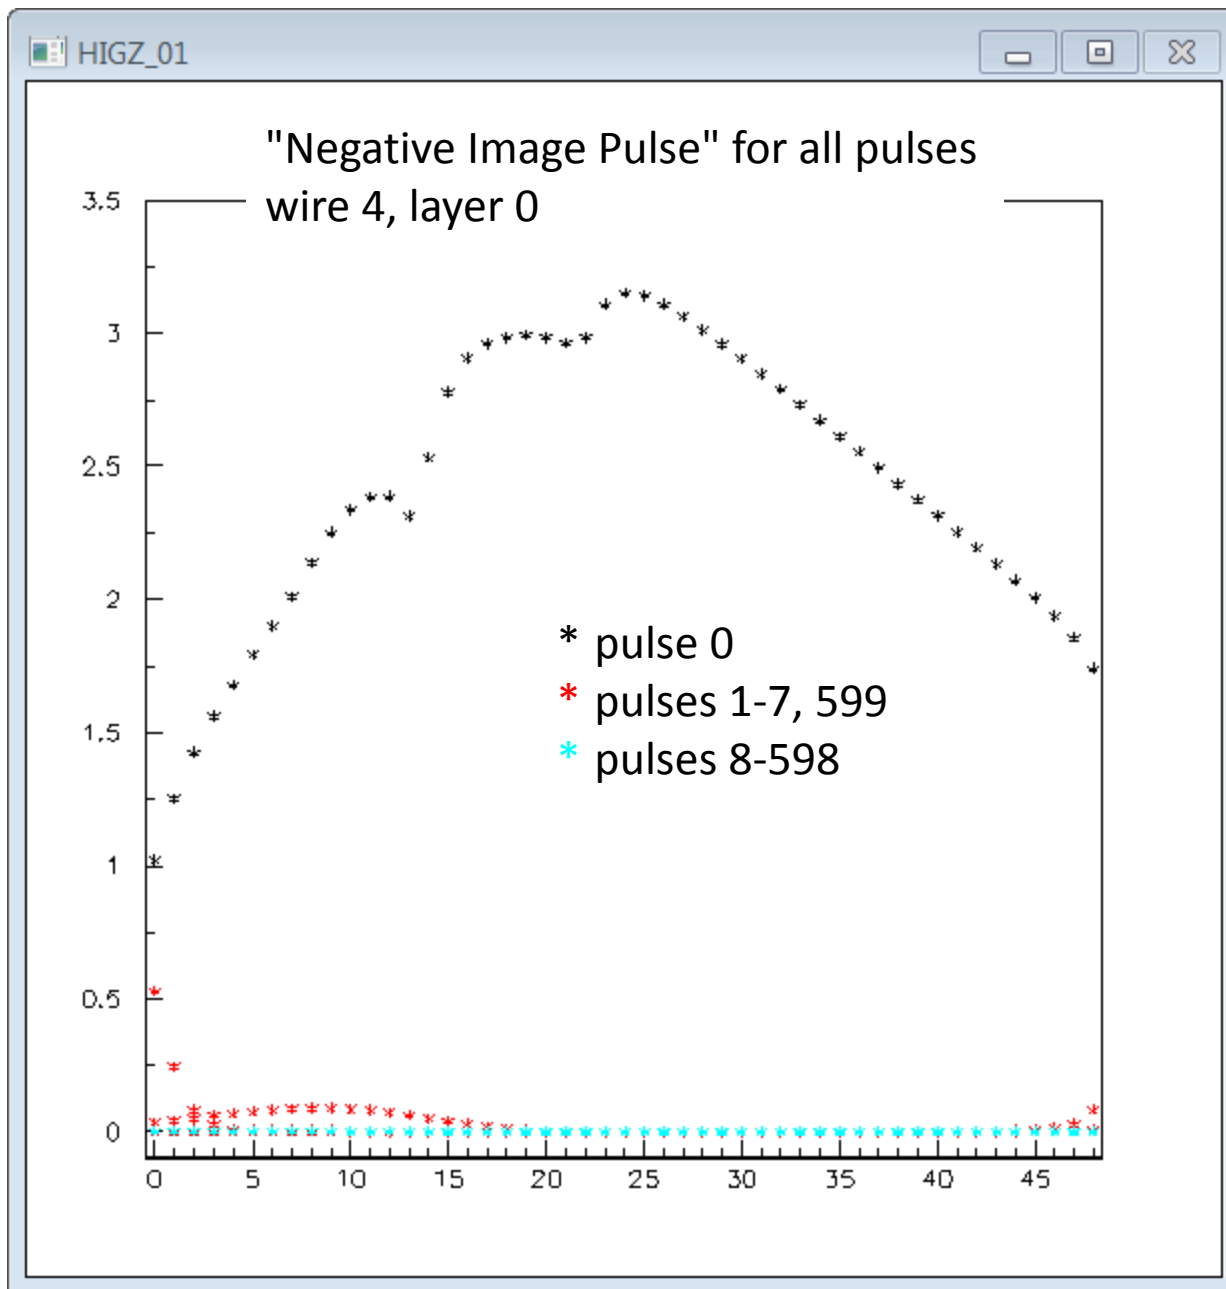

"Negative Image Pulse" for different pulses  
wire 4, layer 0; pulses 1-24, 599

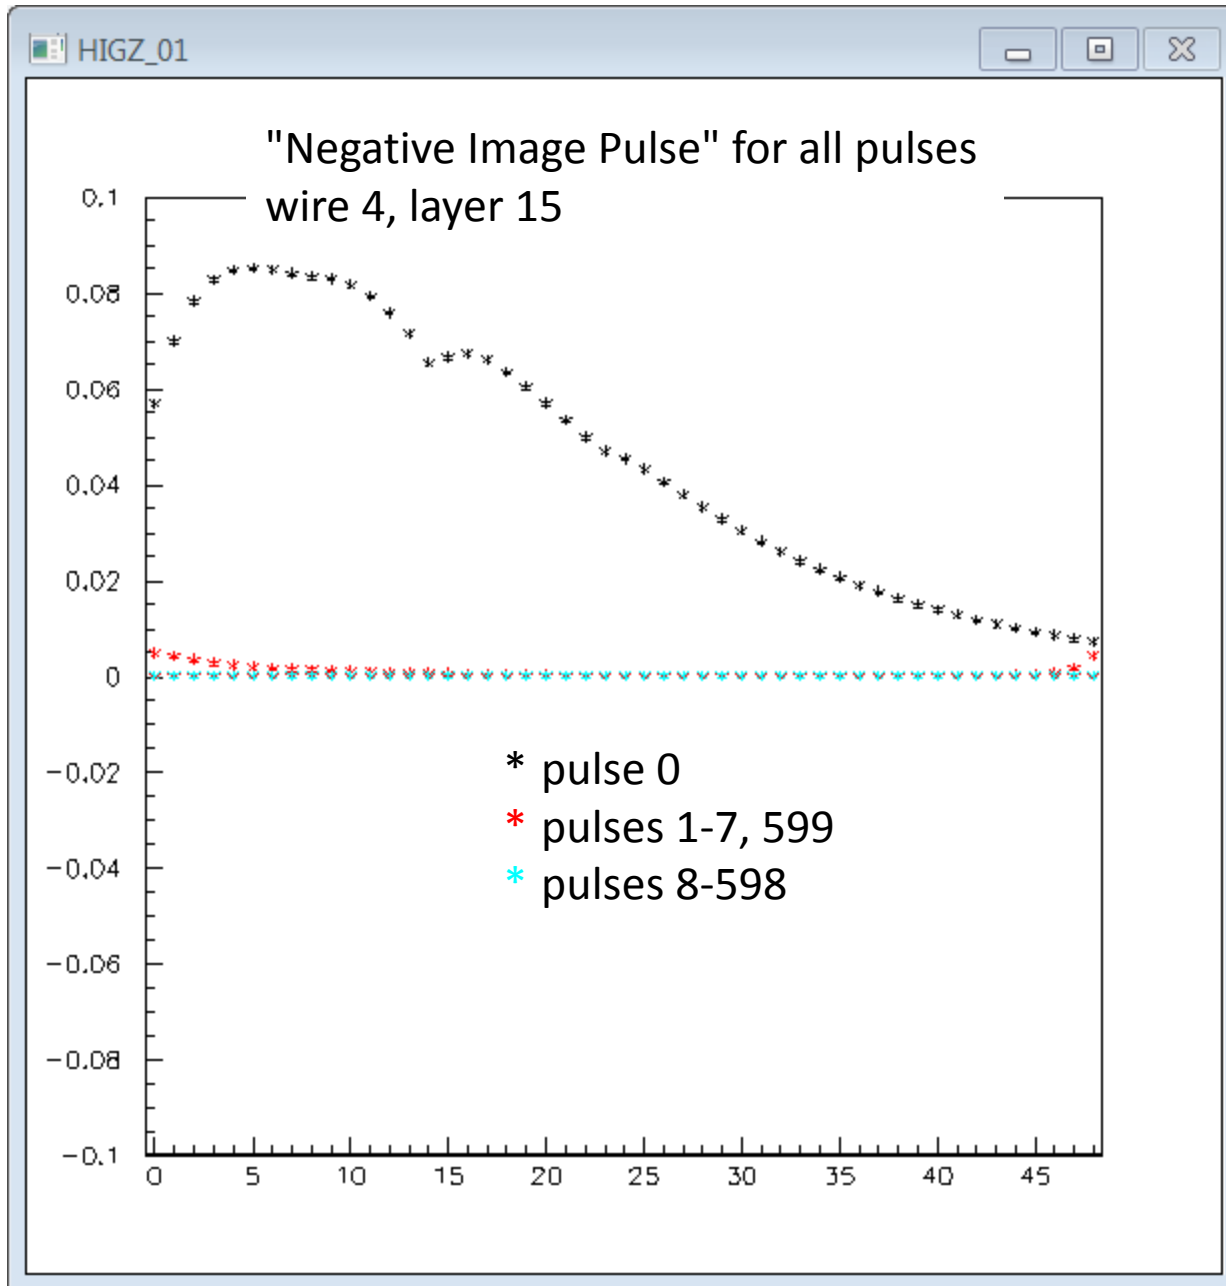

"Negative Image Pulse" for different pulses  
wire 4, layer 15; pulses 1-24, 599

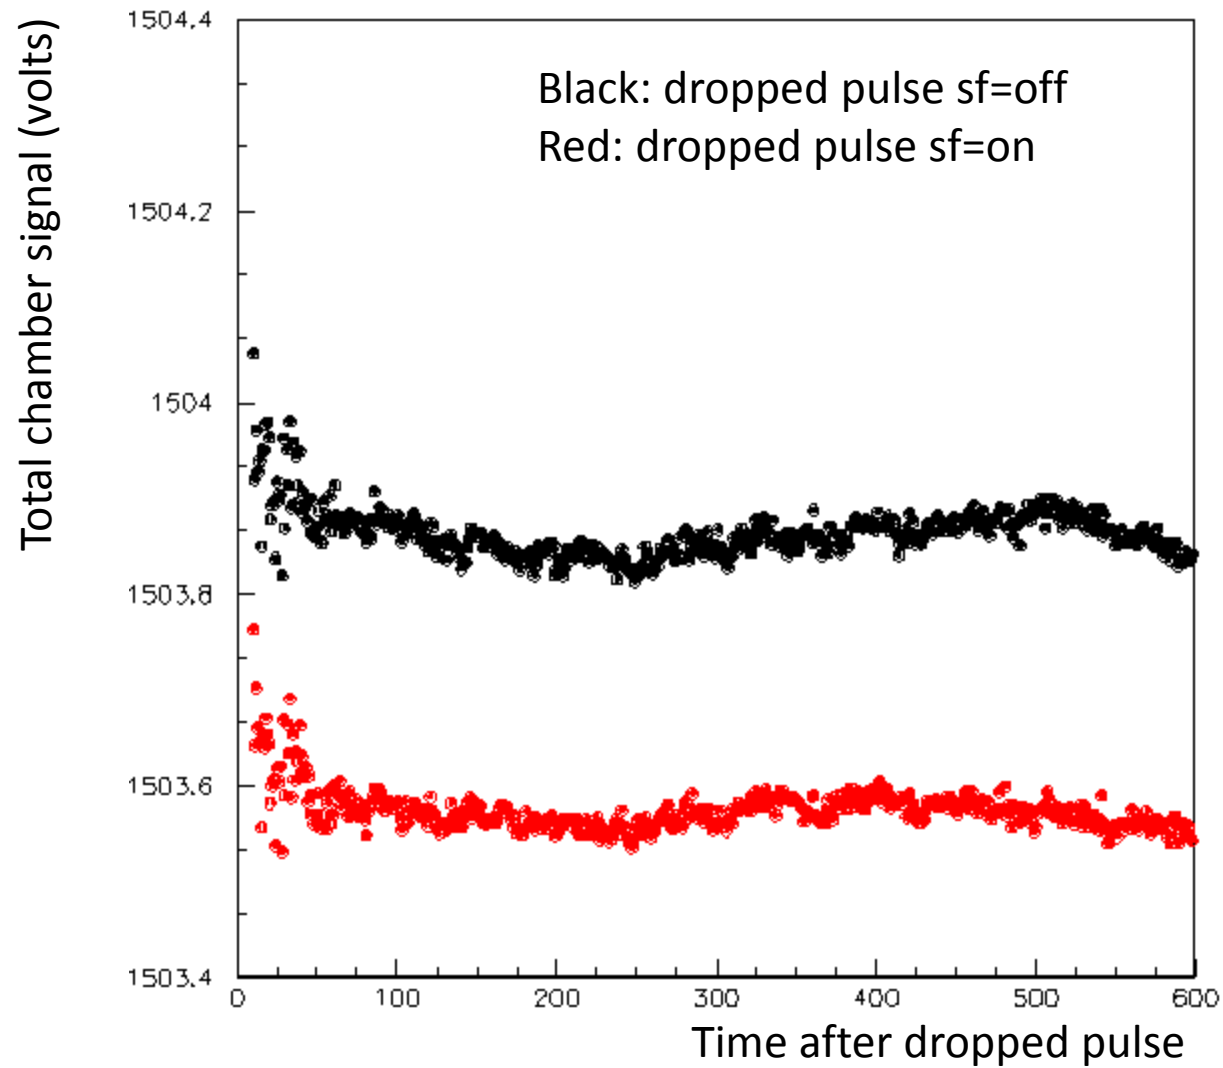

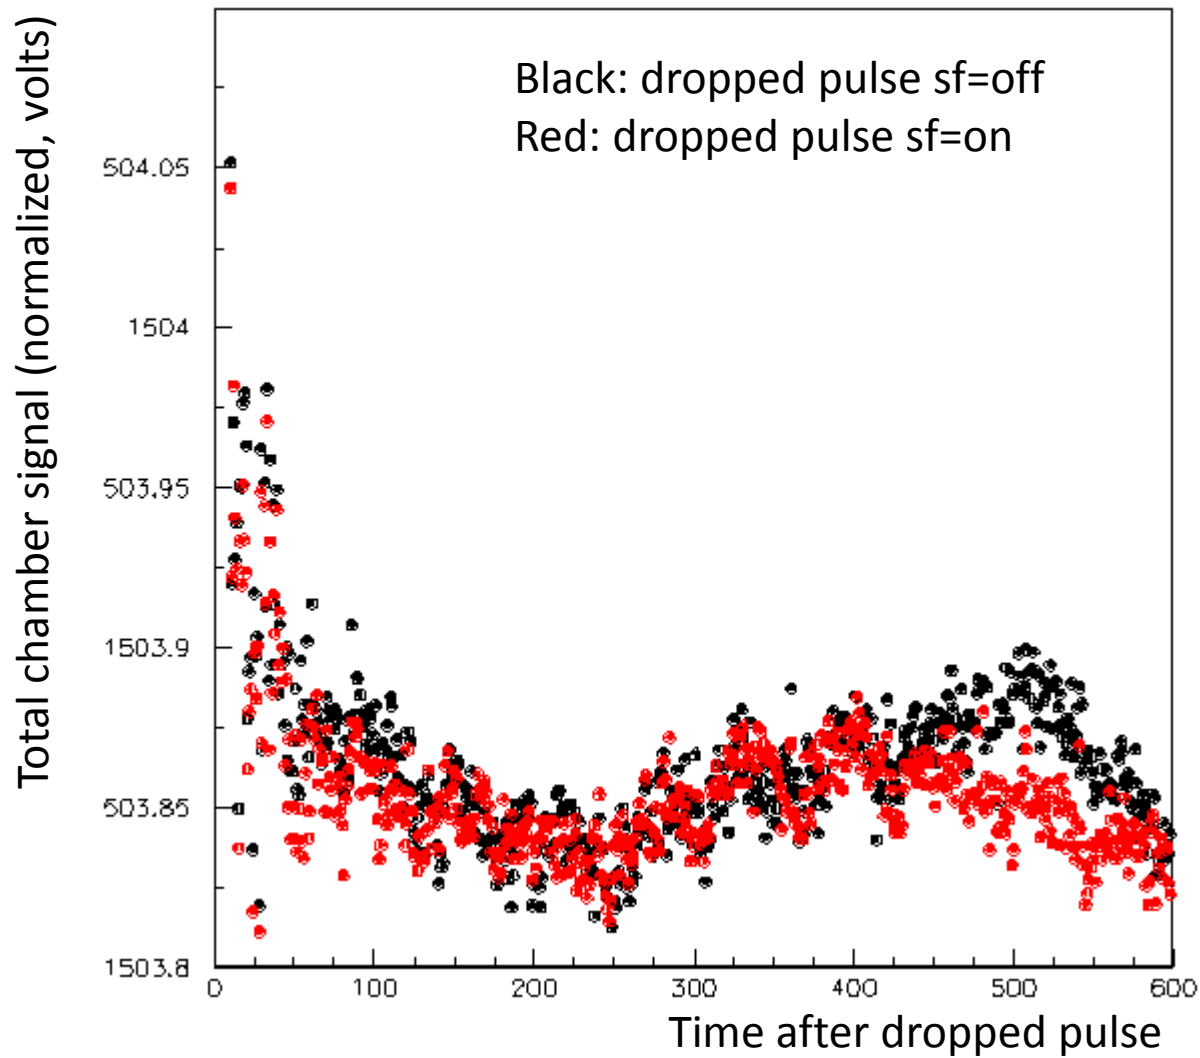

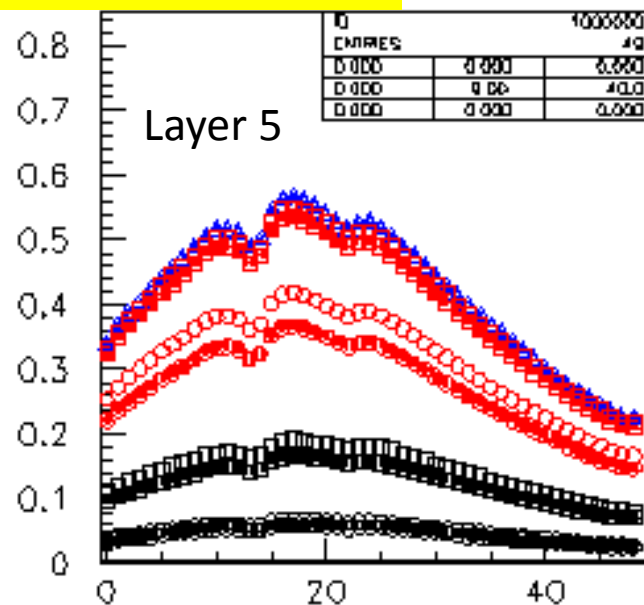

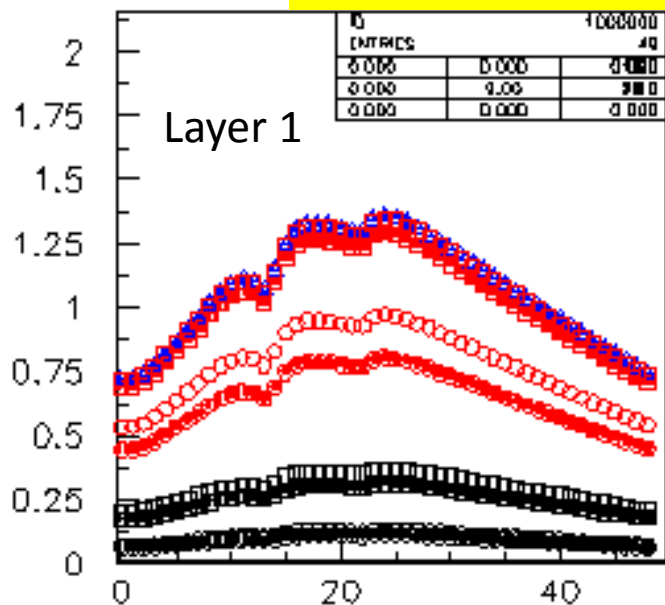

- A couple of things I noticed, just in case they are interesting...
- Average total chamber signal vs. time after a dropped pulse does vary at least a bit...
- Beam not quite centered? Or response unequal left/right?

Open symbols are wires 5-8 (beam left?)

Wire Yield (Volts)

TOF Bin
