DAQ for n - ^3He

- Expectations
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

The n-³He Experiment

- ❑ High-precision measurement motivated to probe the hadronic weak interaction by measuring the parity violating asymmetry of the proton in the reaction-

- ❑ Expected to be extremely small (of the order 10^{-7})
- ❑ Goal is to measure an asymmetry in the reaction to a precision of 2×10^{-8}

DAQ for n³He

DAQ for $n^3\text{He}$

Outline

The n - ^3He experiment

- Motivation
- Experimental Setup

DAQ for n - ^3He

- Expectations
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

□ n - ^3He is using a spin flipper with transverse windings which allows for both longitudinal and transverse spin rotation.

□ ^3He ion chamber – both target and detector

□ Detectors work in current mode.

DAQ for n-³He - Expectations

- ❑ Large amount of data, very high sample rate but very low ADC noise.
- ❑ High channel density with simultaneous input.
- ❑ Maximum sampling rate but the file size manageable /durable.
- ❑ Triggering using software taking accelerator T_0 as input.
- ❑ Can take data only in our region of interest.
- ❑ Time bin and the number of entries per run can be adjusted.
- ❑ Synchronization of all the ADC modules with T_0
- ❑ Checksum algorithm to detect corrupt data .
- ❑ Built in event header.

DAQ for n³He

DAQ for n-³He –Expectations for systematics

- ❑ 1st plane of the detector : 10 V → Full Scale
- ❑ Back plane of the detector: 0.1% of Full Scale
- ❑ Size of asymmetry: $A \sim 10^{-7}$
- ❑ Expected uncertainty in asymmetry : $\Delta A = 2 \times 10^{-8}$ (Statistical)
- ❑ Expected maximum contribution from systematics:

$$\Delta A_{\text{sys}} = 10\% \text{ of } \Delta A$$

- ❑ Expected $\Delta A_{\text{sys}} < 10^{-9}$

DAQ for n³He

- Expectations**
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

DAQ for $n\text{-}^3\text{He}$ -ADC Modules

- ❑ Delta sigma technology based ADC (ACQ1002) by d-tAcq Solutions
- ❑ Zynq 7000 –series hybrid FPGA + 2 ARM CPU cores + FMC
- ❑ 24 bit ADC per channel for true simultaneous analog input.
- ❑ Maximum sampling rate 128 kSPS (minimum is 8 kSPS) per channel.
- ❑ 2x24 Channels per module
- ❑ Signal to noise ratio is 104 dB (high speed) or 108 dB (high resolution)
- ❑ 1GB DDR memory on board
- ❑ External clock, trigger, internal clock.
- ❑ Runs embedded Linux
- ❑ Firmware on a SD card, can be updated easily.

- Expectations
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

ADC Modules

- ❑ The DAQ can be accessed through ssh or console.
- ❑ It has several separate sites for capture and configuration.
- ❑ The data is transferred and saved to control computer using TCP/IP connection (e.g. netcat).
- ❑ Supports EPICS CSS for controlling the DAQ.
- ❑ Data and run time parameters can be viewed in real time using CSS.

Data flow/network diagram

Software

- ❑ Analyze the binary data with ROOT without saving as root file.
- ❑ TBranchBinary
 - Allows one to interpret binary files as ntuples without actually reading them into an ntuple.
 - Gives access to all features of TTree.
 - Access to any ROOT classes.
- ❑ Prototype GUI with DAQ control and online analysis.
- ❑ Prototype analysis library based on TBranchBinary.

DAQ for n³He

Outline

- Motivation
- Experimental Setup

DAQ for n-³He

- Expectations
- ADC modules
- A Complete Network
- Software**
- Measurements

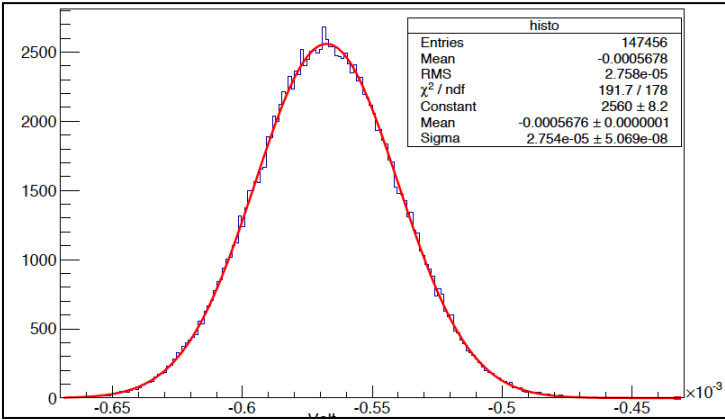

Conclusion

In Progress and Beyond

Measurements

- ❑ Bare ADC noise was measured to be 27micro volt at 50KHz sample rate.
- ❑ Performance of ADC and its noise with different sample rate.
- ❑ Based on counting statistics , running the DAQ at 50KHz and then averaging 20 successive points will give most optimal ADC noise.

- Motivation
- Experimental Setup

DAQ for $n^3\text{He}$

- Expectations
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

Sources of false asymmetries:

- Ground loops
- Electrostatic couplings
- Power supply couplings
- Circuit to circuit couplings
- and many others

Instrumental asymmetries with RFSF

- ❑ Took equal number of entries between two T_0 pulses.
- ❑ Subtracted two adjacent (ON/OFF) states then normalized by the full scale of the ADC(20 Volts)

$$A_1 = (V_1 - V_2) / 20$$

$$A_2 = (V_3 - V_4) / 20 \text{etc.}$$

$$\text{Asymmetry, } A = (A_1 + A_2 + A_3 + \dots + A_N) / N$$

- ❑ To calculate uncertainty in false asymmetry, made a histogram for asymmetry of individual pair, A_k , $k=1, 2, \dots, N$
- ❑ Calculated width σ (sigma or RMS) of the histogram. Then,

$$\Delta A = \sigma / \sqrt{N}$$

DAQ for $n^3\text{He}$

Conclusion

In Progress and Beyond

Instrumental asymmetries with RFSF

❑ Analysis of 5 hour of data at 25KHz shows that-

$$\text{Asymmetry} = 2.64 \times 10^{-10} \pm 1.64 \times 10^{-10}$$

DAQ for n³He

- Experimental Setup

DAQ for n-³He

- Expectations
- ADC modules
- A Complete Network
- Software
- Measurements

Conclusion

In Progress and Beyond

Conclusion, In Progress and Beyond

Conclusion:

- ❑ We have a DAQ system which meets all of our requirements and gives instrumental asymmetry as small as $\sim 10^{-10}$
- ❑ We have the prototype analysis library based on TBranchBinary which enables data analysis using ROOT.

In Progress:

- ❑ Upgrade prototype GUI and analysis library.
- ❑ Measure false asymmetry with the whole system and improved grounding/shielding.

Beyond:

- ❑ Online online analysis :
 - Exploring plot in the browser.
 - Webboot
 - ROOT with IPython notebook.

Autocorrelation Plots for ACQ164 ADC Noise

1. Formalism Followed:

Autocorrelation plots are formed by

- Vertical axis: Autocorrelation coefficient

$$R_h = C_h / C_0$$

where C_h is the autocovariance function

$$C_h = \frac{1}{N} \sum_{t=1}^{N-h} (Y_t - \bar{Y})(Y_{t+h} - \bar{Y})$$

and C_0 is the variance function

$$C_0 = \frac{\sum_{t=1}^N (Y_t - \bar{Y})^2}{N}$$

Note that R_h is between -1 and +1.

- Horizontal axis: Time lag h ($h = 1, 2, 3, \dots$)

2. In the data set there were few (3 or 4) values which were completely out of any scale (10^9 times out of scale), those ADC values were replaced by hand by the average of previous and next ADC value.

3. X-axis unit: 1 lag= 100 micro second (for 10KHz) or 20 micro second (for 50KHz), Y-axis unit: Unitless

Zynq-7000 All Programmable SoC

Based on the Xilinx All programmable SoC architecture, the Zynq®-7000 All Programmable SoCs enable extensive system level differentiation, integration, and flexibility through hardware, software, and I/O programmability.

Using the Zynq-7000 platform, you can design smarter systems with tightly coupled software based control and analytics with real time hardware-based processing and optimized system interfaces — with vastly lower BOM costs, lower NRE costs, lower design risk, and of course much faster time to market. All six Zynq devices (Z-7010, Z-7015, Z-7020, Z-7030, Z-7045, Z-7100) are optimized for specific combinations of system power, cost, and size to meet the needs of smarter control, smarter vision and smarter networks.

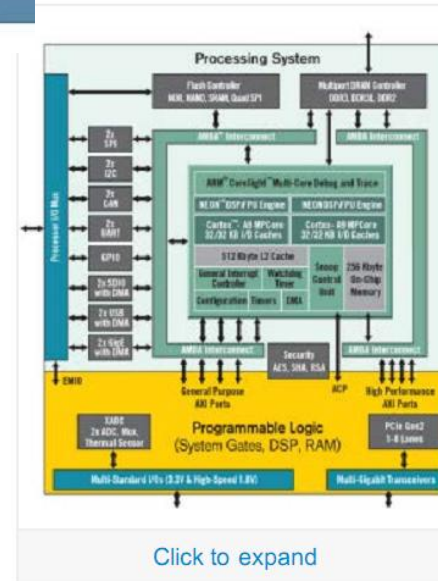

This comprehensive Platform offers:

- [Silicon Devices](#) - Zynq-7000 Full-Featured Processing Platform
- [Development Platforms](#) - Traditional hardware development and virtual development platforms
- [Operating Systems](#) - Open Source Linux, Android, FreeRTOS
- [Design Tools](#) - Vivado® Design Suite, Xilinx SDK, PetaLinux SDK
- [IP](#) - Plug and Play

Smartest Solution for a Wide Range of System Design Problems

Xilinx Zynq-7000 All Programmable SoCs are the Smartest Solution for a wide range of system-design problems in all markets, across the entire application spectrum. Learn more about the 9 reasons why:

Enabling Smarter Systems	<ul style="list-style-type: none">• Most efficient ARM + FPGA for analytics & control• Extensive OS, middleware & stack ecosystem• Highest level of security & reliability Learn More >
Unmatched Performance and Power	<ul style="list-style-type: none">• Highest Performance SoC• Largest & Highest Performance Memory System• Lowest Power and Fastest Logic Fabric Learn More >
Proven Productivity	<ul style="list-style-type: none">• Industry-leading high-level synthesis• Widest selection of software environments and tools• Largest portfolio of IP, design kits, and reference designs Learn More >

Conclusion
In Progress and Beyond

Recently, there has emerged a greater need for different front panel IO functionality within systems. Typically, this front panel IO functionality was fixed on 3U or 6U form factor cards, or it was configured with PMC or XMC modules. Previously, 3U and 6U form factor card design used a fixed front panel IO, which addressed a particular function. Changing the front panel IO functionality meant replacing the 3U or 6U cards. PMC and XMC modules provided configurable front panel IO for 3U and 6U form factor cards. However, PMC and XMC modules use much of the 3U and 6U carrier card area.

FPGA Mezzanine Card, or FMC, as defined in VITA 57, provides a specification describing an I/O mezzanine module with connection to an FPGA or other device with reconfigurable I/O capability. The low profile design allows use on popular industry standard slot card, blade and motherboard form factors, including VME, VPX, CompactPCI, AdvancedTCA, MicroTCA, PCI, PXI, and many other low profile motherboards. The compact size is highly adaptable to many configuration needs and compliments existing common low profile mezzanine technology such as PMC, XMC, and AMC.
