Simulation Method

Error Analysis

Optimizations

## Simulation Goals

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- -Calculate geometry factors
- -Optimize pressure and collimation variables
- -Estimate running time

## **Completed Improvements**

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- -Using mersenne twistor generator
- -Updated beam divergence model
- -Change structure to weighted variables
- -Addition of covariant errors
- -Many small speedups
- -Statisics anomaly resolved

#### Statistics-dependent effect

For simplicity, consider the diagonal approximation to the uncertainty:

$$\frac{1}{\sigma_d^2} \approx \sum_{\kappa} \frac{1}{\sigma_{\kappa}^2}$$
$$\sigma_d = \frac{1}{\sqrt{\frac{1}{\sigma_1^2} + \frac{1}{\sigma_2^2} + \frac{1}{\sigma_3^2} + \dots}} = \frac{1}{\sqrt{\frac{G_1^2}{c_1} + \frac{G_2^2}{c_2} + \frac{G_3^2}{c_3} + \dots}}$$

The factors  $c_i$  consist of terms which converge very rapidly. The  $G_{\kappa}$  fluctuate randomly in (-1,1) as sample size is increased. As the sample size gets large, they approach their true value. Since they appear squared in all terms, factors which are slightly too large will have a significant effect on the value of  $\sigma_d$ . For statistically insufficient sample sizes,  $\sigma_d$  is underestimated. With a large enough sample size, the value stabilizes.

Chamber Geometry; Cross-Section View

View in the yz-plane of the wire chamber.

# Cell Model

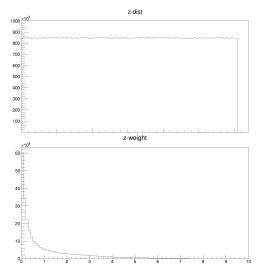

1. Model the wire chamber as 144 cells which collect all charge deposited in a parallelepiped set by the surrounding high voltage wires.

2. Each cell is  $1.9 \text{ cm} \times 1.9 \text{ cm} \times 17.1 \text{ cm}$ . (There is a small correction to the volume of the top and bottom row of cells, since they are smaller).

3. Assume the  $^{3}\text{He}$  is contained inside the total cell volume. This is the  $^{3}\text{He}$  "buffer."

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

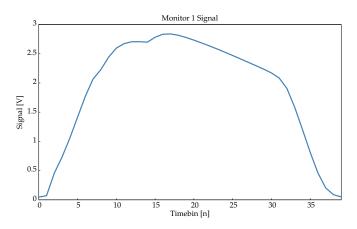

# Weighting Scheme

Instead of using kinematic variables, use normally distributed variables in x,y,z, and t, with corresponding weights.

# Tracking Matrix

## **Geometry Factors**

Ion Chamber Geometry Factors for P=7psi, coll=6cm; alpha = 3.075

<□▶ <□▶ < □▶ < □▶ < □▶ < □▶ = のへぐ

# Quantities

To calculate geometry factors and our dilution factor, we will need to track the mean energy deposited into a cell, the mean energy weighted by the cosine, and the mean covariant energy between two different cells.

 $egin{aligned} & \langle E^\kappa 
angle \ & \langle E^\kappa \cos heta 
angle \ & \langle Q^{\kappa\beta} 
angle \end{aligned}$ 

## Calculation of $\alpha_{\kappa}$

The element asymmetry  $\alpha_{\kappa}$  depends on  $G_{\kappa}$  and the measured yields of that element.

$$Y_h^{\kappa} = \langle E^{\kappa} (1 + h\alpha \cos \theta) \rangle$$

$$\frac{Y_{+}^{\kappa} - Y_{-}^{\kappa}}{Y_{+}^{\kappa} + Y_{-}^{\kappa}} = \alpha_{\kappa} \frac{\langle E^{\kappa} \cos \theta \rangle}{\langle E^{\kappa} \rangle} \Rightarrow G_{\kappa} = \frac{\langle E^{\kappa} \cos \theta \rangle}{\langle E^{\kappa} \rangle}$$

$$\alpha_{\kappa} = \frac{1}{G_{\kappa}} \frac{Y_{+}^{\kappa} - Y_{-}^{\kappa}}{Y_{+}^{\kappa} + Y_{-}^{\kappa}}$$

(ロ)、(型)、(E)、(E)、 E) の(()

#### Calculation of $\alpha$

We will combine each element asymmetry to form the combined physics asymmetry.

$$\alpha = \sum_{\kappa} \mathbf{w}_{\kappa} \alpha_{\kappa} = \vec{\mathbf{w}} \cdot \vec{\alpha}$$

$$\sum_{\kappa} w_{\kappa} = 1$$

Choose weighting that minimizes uncertainty.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

#### Error in $\alpha$

$$\sigma_{\alpha}^{2} = \sum_{i} \sum_{j} \frac{\partial \alpha}{\partial \alpha_{i}} \frac{\partial \alpha}{\partial \alpha_{j}} \sigma_{\alpha_{i}\alpha_{j}} = \sum_{i} \sum_{j} w_{i} w_{j} \sigma_{\alpha_{i}\alpha_{j}} = \vec{w}^{\mathsf{T}} \cdot \hat{\sigma}_{ij} \cdot \vec{w}$$

Must have method to calculate  $\hat{\sigma}_{ij}$  from fundamental quantities:

$$\sigma_{\alpha_{\kappa}\alpha_{\beta}} = \frac{\langle Q^{\kappa\beta} \rangle}{2 \langle E^{\kappa} \cos \theta \rangle \langle E^{\beta} \cos \theta \rangle}$$

For diagonal elements, this reduces to:

$$\sigma_{\alpha_{\kappa}}^{2} = \frac{\langle E^{\kappa^{2}} \rangle}{2 \langle E^{\kappa} \cos \theta \rangle^{2}}$$

◆□ ▶ < @ ▶ < E ▶ < E ▶ E 9000</p>

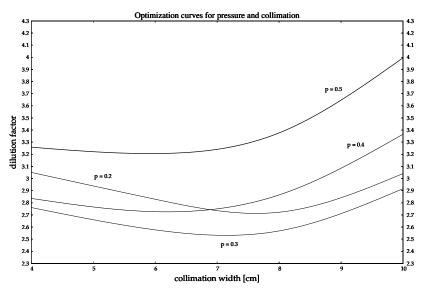

# Optimization

$$\frac{\partial \sigma_{\alpha_{\kappa}}^2}{\partial w_k} = \lambda_k \frac{\partial (\sum_i w_i - 1)}{\partial w_k}$$

$$\Rightarrow$$
 minimized  $\sigma_{lpha_{\kappa}}^2 = \sum_i \sum_j \hat{\sigma}_{ij}^{-1}$ 

Apply to pressure and collimation parameters.

#### Results

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 - のへで

#### Planned Improvements

-New beam scan will improve precision of x-y positioning. -Drift time analysis will give more realistic signal timing.
